My name is Kevin Hooper. I am an engineer with SnapNrack. William Miller of Miller Solar has asked me to clarify the installation criteria for our Series 200 Ground Mount product line.

The 200 Series Ground Mount System is intended for supporting solar panels in ground-mounted applications. The SnapNrack 200 series product line requires a support structure underneath the SnapNrack proprietary extruded rails. For the convenience of installers, SnapNrack offers pre-designed and engineered support structure systems utilizing products that can be purchased through SnapNrack distributors. These systems are not considered kits and SnapNrack does not require that installers use one of these pre-designed systems to purchase and install any of the SnapNrack offered products. If an installer wants to create an alternative support system, SnapNrack considers this acceptable and this in itself is not to be considered to be in violation of our installation instructions (the requirement for engineering of any alternative support structure is the prerogative of the building authority that has jurisdiction based on that jurisdiction's written requirements). SnapNrack only requires that the equipment manufactured and sold by SnapNrack be installed in accordance with the applicable sections in the Series 200 Residential Ground Mount Installation Manual.

I hope this helps clarify the position of SnapNrack regarding support structures and installation for the Series 200 Ground Mount System.

Sincerely,

Kevin Hooper
Application Engineer
